A DNA sequence (T48239) codes for the alpha-7 subunit (W09025) of the human neuronal nicotinic acetylcholine receptor (nAChR). Host cells, esp. mammalian cells or amphibian occytes, carrying alpha-7 nucleic acids, opt. in combination with other alpha and/or beta subunit nucleic acids (see also T48232-38, T48240-41), express recombinant nAChR subunits useful for identifying cpds. that modulate the activity of human nAChRs.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC The present sequence encodes a human neuronal nicotinic acetylcholine CC receptor (NAChR) subunit. The cells expressing the alpha and/or beta CC NAChR subunits may be used in a method of screening compounds to CC identify any which modulate the activity of human neuronal NAChR. CC Subunit specific antibodies may be used to monitor the distribution and expression density of various subunits in normal vs diseased brain CC tissues. Testing of single receptor subunits or specific receptor CC provides informations with a variety of potential agonists or antagonists or combinations with a variety of potential agonists or antagonists of individual subunits and should lead to the identification and design of compounds that are capable of very specific interaction with one or unwanted side effects than drugs identified e.g. screening with cells that express a variety of subtypes.

Claim 14; Fig 2; 44pp; English.
Claim 14; Fig 2; 44pp; English.
This sequence encodes the V247T variant of human alpha7 nicotinic acetylcholine receptor (nAChR) subunit of the invention. Cells containing the DNA are used to express the protein and to identify modulators of alpha7 nAChR activity or cytoprotective agents, e.g. antisense compounds or antagonists that are potentially useful for treating neurodegeneration, enzyme dysfunction, affective disorders and immune dysfunction, such as cancer, post-herpetic neuralgia, diabetic dysfunction, such as cancer, post-herpetic neuralgia, diabetic
                                                                                                                                                                                                                                               P-PSDB; W69216.

Nucleic acid encoding variant of human alpha7 nicotinic nodulators to identify modulators

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    δÃ
subunit (W12368) and alpha2 subunit (W12369) of chick neuronal
calpha-bungarotoxin binding protein (ABBP). They were isolated from
an 18-day embryo chick brain cDNA library using a probe (see also
can 18-day embryo chick brain cDNA library using a probe (see also
can 18-day embryo chick brain amino acid sequence of chicken
brain ABBP. The probe isolated partial clone pCh29-1, which
encoded the N-terminal portion of alpha1. A subclone, pCh29-3
can (ATCC 40641), was used to rescreen the library yielding clone
pCh31-1 (ATCC 40640), which encoded the entire alpha2 sequence.
A probe based on the C-terminal region of pCh31-1 was used obtain
calpha1. The cDNA clones can be used as probes to identify further
ABBP subunits, and in the recombinant prodn. of ABBP.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            psychosis and schizophrenia. Probes based on the DNA are used to detect the DNA in usual hybridisation or amplification tests, while monoclonal antibodies are used to detect the protein for diagnosis (in vitro or by in situ immuno-fluorescent assay). Compared with wild-type alpha7 nAChR, the protein has about 100-fold greater sensitivity to cholinergic receptor agonists (nicotine or acetylcholine) and response to these agonists decays more slowly, but the wild-type inward rectification is
                                                                                                                                                                                                         binding, ion channel or other activities of the protein.

                                                                                                                                                                                                                                                                                                                                                                                                                    S Claim 1; Fig 3A-B; 18pp; English.

2 cDNA clones (T59196 and T59197) respectively code for the alphal cubunit (W12368) and alpha2 subunit (W12369) of chick neuronal cubunit (W12368) and alpha2 subunit (W12369) of chick neuronal class of chick neuronal class of chick protein (ABBP). They were isolated from 18 day embryo chick brain cDNA library using a probe (see also T59198) based on the N-terminal amino acid sequence of chicken coded the N-terminal amino acid sequence pCh29-1, which class of chicken of alpha1. As subclone, pCh29-3 class of the N-terminal portion of alpha1. As subclone, pCh29-3 class of the N-terminal portion of alpha1. As subclone, pCh29-3 class of the N-terminal portion of alpha1. As subclone, pCh29-3 clone pCh31-1 (ATCC 40640), which encoded the entire alpha2 sequence. A probe based on the C-terminal region of pCh31-1 was used obtain clone pCh34-1 (ATCC 40639), encoding the C-terminal portion of alpha1. The cDNA clones can be used as probes to identify further abpha clones condition of ABBP subunits, and in the recombinant prodn. of ABBP.

                                                                                                                                                                                           New neuronal nicotinic acetyl:choline receptor - compsns. contg.

The sequence and sequences encoding them.

Claim I; Fig 3; 47pp; English.

The sequence encodes a novel neuronal nicotinic acetylcholine
receptor subunit, beta 4. Plasmid pzPC13 (ATCC 67893) was
isolated from a cDNA library in lambda ZAP II prepd. from rat
isolated from a cDNA library in lambda ZAP II prepd. from rat
the sequence of the cDNA in the region encoded by the 5th
exon is identical to that determined for the genomic clone with.
the exception of a sustn. at posn. 720 of a t for a c (this does
not alter the AA sequence); this may be due to a polymorphism
between the rat strains used for the genomic library and the cDNA
library, or could have resulted from a reverse transcriptase error
during prepn. of the cDNA. A sequence, the core of which is 44 bp
long is repeated three times at the beginning of the 3' UT region.
The function of this remains unknown. The protein subunit can
combine with the known subunits, alpha-2,-3, and -4, and beta-2
to form previously unknown functional receptors. The new subunit
is expressed in the central and peripheral nervous systems and in
Secuence 2460 RB. 510 A. 767 C. 587 T.

CC The specification describes antisense oligonucleotides (X52869-X55271) CC directed against at least 2 mRNAs selected from target genes, coding and CC non-coding regions of RNAs corresponding to target genes, gene CC initiation codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'-end and the juxta-section between coding and non-coding CC regions and all segments of RNAs encoding proteins associated with one CC may be derived from sequences X55272-74. These multiple target CC may be derived from sequences X55272-74. These multiple target CC are those associated with impaired respiration and inflammation, CC are those associated with impaired respiration and inflammation, CC allergic rhinitis, acute asthma, allergies, asthma, impeded respiration, pulmonary vasoconstriction, emphysema, chronic obstructive CC hypertension, pulmonary vasoconstriction, emphysema, chronic obstructive cancer, hepatoccellular carcinoma, kidney cancer, breast cancer, pancreatic cancer, hepatoccellular carcinoma, kidney cancer, may metastasize or have metastasized to the lungs, including breast and prostate cancer. 21328 T; Sequence 114955 BP; 6071 A; 29417 C; 36712 G; 21328 T;

New transcription factor designated FREACI1 - which regulates adipose tissue expressed genes involved in lipid metabolism and adipocyte differentiation, used to, e.g. inhibit gene expression Claim 1; Fig 1; 23pp; English.

This sequence represents the Freacil gene of the invention. The encoded protein has transcription regulative function directed against adipose tissue expressed genes. The protein is involved in lipid metabolism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               conventional starch applications, e.g. starch hydrolysate productions, papermaking, adhesives, textiles, building materials, so stabilisation, agrochemicals, pharmaceuticals, cosmetics, coal briquettes, ore and coal slurries, foundry casting, rubber, lea and synthetic polymers. The enzyme produces a starch stated to different physicochemical properties, especially viscosity and gelling properties, from wild type starch.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         888888888888888
                                                                                        PT CDNA encoding soluble starch synthase - used to produce transgenic properties with increased capacity for producing and storing starch producing soluble starch producing starch synthase (SSS). They were isolated from a maize CC cDNA clones SSS10.52, SSS6.31 and SSS56 (T67285-87) code for maize CC inbred line W64A library by screening with a probe (T67288) based CC on pea SSS, rice SSS and maize GBSS. The cDNAs can be used to CC produce plants with an increased capacity for producing starch, or CC a capacity to produce starch with an altered fine structure. They CC can also be used to isolate the corresponding genomic sequences CC from crop plants, to determine the contribution of the SSS gene to CC of starch produced by the plant. Transgenic plants (sep. maize) CC can be used to produce hybid plants which have higher rates of CC starch synthesis at temperatures above the normal optimum.

The DNA or protein can be used as drugs for treating obesity-related conditions to increase or decrease the activity of adipocyte expressed genes, e.g. FREACII can be used as a drug that blocks the cis elements of adipose expressed genes to inhibit gene expression; antisense constructs of Freacil can be used to down regulate expression. The FREACI1 protein can also be used for high throughput screening for substances that affect the activity of FREACI1, such as inhibitors, antagonists, or agonists. Conditions which can be treated include obesity, non-insulin dependent diabetes mellitus, cardiovascular diseases, catabolic conditions, anorexia, bulimia.

The present sequence represents an isolated nucleic acid molecule which has been isolated and comprises a nucleotide sequence encoding a polypeptide having soluble starch synthase (SSS) activity, where the polypeptide is encoded by a maize gene. The isolated nucleic acid molecule can be used to produce transgenic plants with altered starch production. The transgenic plants produced using the nucleic acid molecule have an enhanced ability to produce structurally-altered starch sequence 2990 BP; 758 A; 655 C; 801 G; 776 T;

Transcriptional regulator gene family containing bromodomain - may be expressed in testis tissue and is useful for treatment of cancer and other proliferative disorders

Claim 2; Page 125-137; 187pp; Japanese.

This sequence encodes the human BA21-beta protein, a member of a family of transcriptional regulator genes containing a bromodomain (BAZ, Bromodomain with Atypical Zinc finger) which are expressed specifically in testis tissue and also in certain tumour lines. Transgenic cells may be used for the preparation of the BAZ1-alpha, BAZ1-beta, BAZ2-alpha and BAZ2-beta proteins. These proteins can be used in the treatment of cancer and other proliferative disorders, and in screening of compounds for their binding ability to the expression products (e.g. for use as drugs by modulation of transcriptional regulation).

A DNA sequence (T48241) codes for the beta-4 subunit (W09027) of the human neuronal nicotinic acetylcholine receptor (nAchR). Host cells, esp. mammalian cells or amphibian occytes, carrying beta-4 nucleic acids, opt. in combination with other alpha and/or beta subunit nucleic acids (see also T48232-40), express recombinant nAchR subunits useful for identifying cpds. that modulate the activity of human nAchRs.

                                                                                                                                                                                                                                                                                                       Transcriptional regulator gene family containing bromodomain - may
the expressed in testis tissue and is useful for treatment of cancer
and other proliferative disorders
Claim 2; Page 145-157; 187pp; Japanese.
This sequence encodes the human BAZ1-beta protein, a member of a
cfamily of transcriptional regulator genes containing a bromodomain (BAZ,
Bromodomain with Atypical Zinc finger) which are expressed specifically
in testis tissue and also in certain tumour lines. Transgenic cells may
be used for the preparation of the BAZ1-alpha, BAZ1-beta, BAZ2-alpha and
BAZ2-beta proteins. These proteins can be used in the treatment of cancer
and other proliferative disorders, and in screening of compounds for
their binding ability to the expression products (e.g. for use as drugs
by modulation of transcriptional regulation).

This DNA encodes a cytoplasmic tyrosine kinase which has enhanced expression in connection with blood cell line. The DNA sequences and isolated from the human UT-7 blood cell line. The DNA sequences and antibodies raised against the enzyme, are usful for screening agents for inhibiting or activating activity on the tyrosine kinase, for use as anticancer agents.

Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
